

Quantum Psychology

BLUE DAWN

Proposal:

Quantum Psychology.

Hypothesis:

Human consciousness interprets reality using theoretical quantum biological features.

Human consciousness interprets reality through the ego illusion of self, to force binary in a quantum system. This fulfills the purpose of data compression and defence mechanism to maintain balance in both systems.

Theory:

The human consciousness interprets reality through the illusion of self to force binary in a quantum system.

This illusion of self, henceforth referred to as ego, is the lense through which the base level reality is interpreted. The formation of the ego is instinctual and unique to each individual, leading to a layer of abstraction within each individual's perceived reality (i.e. water is water, the meaning of that depends on the individual and their personal circumstances).

The subconscious is not the subconscious, but the quantum conscious processing the base level information without bias forced by ego. The amount of information present in base level reality is too complex for the human brain to process real-time without sacrificing resources better allocated to survival. The evolution of the self allowed energy to be allocated to improving reality instead of existing in it. Evolution did not stop, it pivoted and became centered around constantly seeking improvement in other ways i.e. refinement of current technique ad infinitum.

In this theory, the evolution of ego, self, coincides with evolution of quantum biocircuitry parallel with physical changes in the brain (i.e. refined as the species progressed with each successful generation, homo erectus to homo sapien).

Quantum biological features allow access to intra-reality, the binding force that allows oppositional forces like matter and anti matter to co-exist.

Intra-reality is where quantum consciousness exists, quantum biological features of the brain allow access. Reality is processed by the quantum consciousness and the ego simultaneously. The ego processes the information to be stored as binary while acting as the evolutionary safety switch and maintaining balance.

In terms of Quantum Psychology, The ego processor can be overwhelmed with feedback loops of complexity. More complexity, more chances for miscoded information [decoherence], the ego fights this by trying to make sense by imposing more complexity. This eventually leads to symptoms presenting at the surface level.

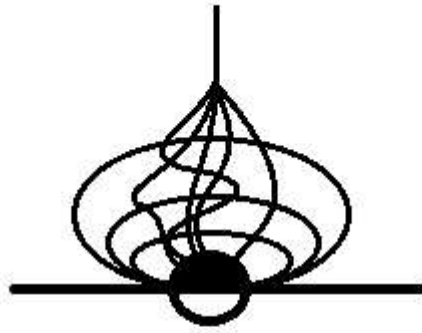

Diagram: quantum information processed by the ego, the negative space is representative of the bio circuitry connection to intra-reality.
